DETAILED ACTION

Specification

2. The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

The following title is suggested: Rotary blade compressor with eccentric axial biasing.

Claim Rejections - 35 USC § 102

3. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

4. Claim 12 is rejected under 35 U.S.C. 102(b) as being anticipated by Hill et al. (US 6030192). Hill et al. discloses a rotary compressor, comprising a compression mechanism including a cylinder (inside 11) having a cylinder chamber, a piston (accommodated in the cylinder chamber eccentrically with respect to the cylinder, and a blade arranged in the cylinder chamber and defining the cylinder chamber into a first chamber and a second chamber, at least one of the cylinder and the piston rotating eccentrically as an eccentric rotation body; a drive shaft configured for driving the compression mechanism; a pressing mechanism configured for bringing a cylinder side end plate (16), which is provided at one end in an axial direction of the cylinder chamber and faces an end face in an axial direction of the piston (26), and a piston side end plate (bottom plate of Fig. 1), which is provided at the other end in the axial direction of the cylinder chamber and faces an end face in an axial direction of the cylinder, close to each other in an axial direction of the drive shaft (52); and a casing (10) configured for accommodating the compression mechanism, the drive shaft, and the pressing mechanism, the pressing mechanism (93) being eccentric away from a center of the cylinder side (12) or the piston side end plate of the eccentric rotation body, the pressing mechanism generating an axial-direction pressing force (downward) with a center of the pressing mechanism being eccentric away from a center of the drive shaft (52), and the cylinder having a slit (94) that is formed at a portion eccentric from a center of the eccentric rotation body (16) in a face portion (face above 89) opposite a face on a cylinder chamber side of the cylinder side end plate of the eccentric rotation body (16), the slit being disposed on only one side of the cylinder relative to the drive

shaft and being open in a radially inward direction (89) facing the drive shaft (facing downward) in order to receive the pressure of fluid discharged outside the compression mechanism to work on the slit (90, 91, Fig. 1).

Allowable Subject Matter

5. Claims 1-4 and 6-11 are allowed.

Response to Arguments

6. Applicant's arguments with respect to claims 1-4 and 6-12 have been considered but are moot in view of the new ground(s) of rejection.
